

CONVEYORS, INC.

PROBLEM SOLVER

Challenge: Is your conveyor not performing properly or your common wear components failing prematurely?

Solution: Conveyor alignment is the most common cause to these problems. A simple check on your conveyor alignment could correct the issues and give more life to your components. The conveyor alignment can be performed using a simple string supported at two common points a couple inches away from both ends on the conveyor. With the string pulled tight you should be able to check the up and down along with the side to side measurements along several points of the conveyor. Still not certain on how to do this properly? Contact your local AD Distributor to ask about Conveyors Inc's Technical Field Support option. Conveyors Inc is so much more than just a company selling products. We are a company providing solutions and delivering results.
